

جامعة تشرين  
هندسة الاتصالات والإلكترونيات  
السنة الخامسة الفصل الثاني  
برمجة شبكات  
الوظيفة الأولى:

الاسم : مصطفى احمد ناصر  
رقم الجامعي : 2106

السؤال الأول:

-A

اكتشاف الرقم المدخل من قبل المستخدم اذا كان سالب ام موجب ام صفر:

```
number_for_test=int(input("Enter a integer number: "))
if number_for_test > 0:
    print("this is positive")
elif number_for_test==0:
    print("this is Zero")
else:
    print("this is negative")
```

الخرج سوف يكون بالشكل التالي :

```
Python 3.8.8 (default, Apr 13 2021, 15:08:03) [MSC v.1916 64 bit (AMD64)]
Type "copyright", "credits" or "license" for more information.

IPython 7.22.0 -- An enhanced Interactive Python.

In [1]: runfile('C:/Users/M.tech/Desktop/untitled0.py', wdir='C:/Users/M.tech/Desktop')
Enter a integer number: -3
this is negative
In [2]:
```

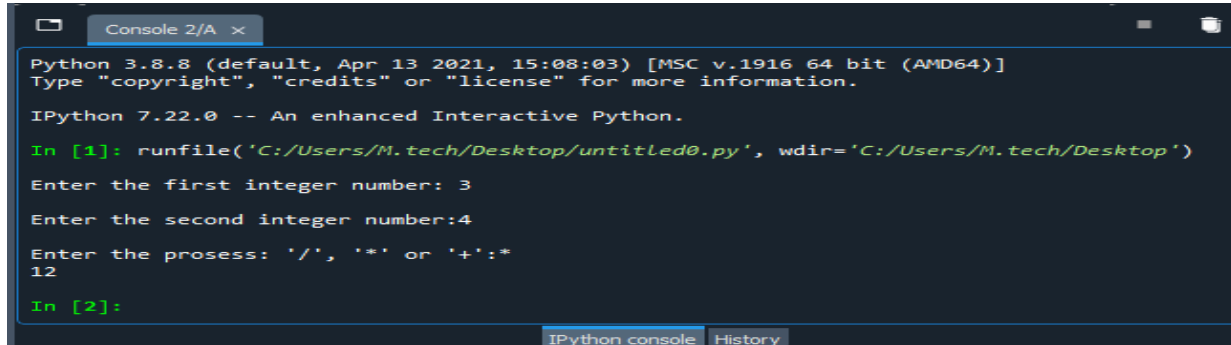

-B

ادخال رقمين من قبل المستخدم والعملية الحسابية بينها وإظهار النتيجة :

```
number1 = int(input("Enter the first integer number: "))
number2 = int(input("Enter the second integer number:"))
p= str(input("Enter the proses: '/', '*' or '+:"))
if p == '*':
    print(number1*number2)
elif p == '/':
    print(number1/number2)
elif p == '+':
    print(number1+number2)
elif p == '-':
    print(number1-number2)
```

```
else:  
    print("Couldn't detect an operation!")
```

الخرج سيكون بالشكل التالي :

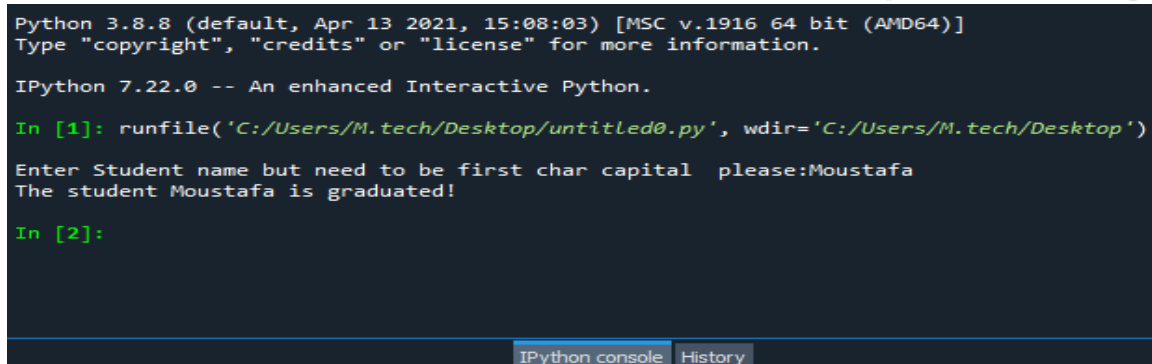

```
Python 3.8.8 (default, Apr 13 2021, 15:08:03) [MSC v.1916 64 bit (AMD64)]  
Type "copyright", "credits" or "license" for more information.  
  
IPython 7.22.0 -- An enhanced Interactive Python.  
  
In [1]: runfile('C:/Users/M.tech/Desktop/untitled0.py', wdir='C:/Users/M.tech/Desktop')  
  
Enter the first integer number: 3  
Enter the second integer number: 4  
Enter the proses: '/', '*' or '+': *  
12  
  
In [2]:
```

-C

لدينا مجموعة أسماء لطلاب متخرجين يتم اختبار اسم الطالب المدخل من قبل المستخدم اذا كان منهم فالطالب متخرج والا فهو ليس متخرج و يجب مراعاة الحرف الكبير في كل اسم :

```
gStudents = ['Moustafa', 'Khalad', 'Rana', 'Heba', 'Adnan', 'Ahmad']  
name = input("Enter Student name but need to be first char capital please:")  
if name in gStudents:  
    print("The student " + name + " is graduated!")  
else:  
    print("Student " + name + " is NOT graduated.")
```

الخرج سوف يكون بالشكل التالي :

```
Python 3.8.8 (default, Apr 13 2021, 15:08:03) [MSC v.1916 64 bit (AMD64)]  
Type "copyright", "credits" or "license" for more information.  
  
IPython 7.22.0 -- An enhanced Interactive Python.  
  
In [1]: runfile('C:/Users/M.tech/Desktop/untitled0.py', wdir='C:/Users/M.tech/Desktop')  
  
Enter Student name but need to be first char capital please:Moustafa  
The student Moustafa is graduated!  
  
In [2]:
```

- D

طباعة الأرقام الفردية بين 1-100 باستخدام ال list :

```
list = [num for num in range(0,100) if num%2 != 0]
print(list)
```

الخرج سوف يكون بالشكل التالي:

```
Python 3.8.8 (default, Apr 13 2021, 15:08:03) [MSC v.1916 64 bit (AMD64)]
Type "copyright", "credits" or "license" for more information.

IPython 7.22.0 -- An enhanced Interactive Python.

In [1]: runfile('C:/Users/M.tech/Desktop/untitled0.py', wdir='C:/Users/M.tech/Desktop')
[1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47,
49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93,
95, 97, 99]

In [2]:
```

-E

طباعة اكبر سلسلة موجودة ضمن ال

List

```
list = ['Network' , 'Math' , 'Programming', 'Physics' , 'Music']
newList = []
for i in range(len(list)):
    newList.append(len(list[i]))
longestItem = max(newList) # 11
for s in range(len(newList)):
    if newList[s] == longestItem:
        index = s
print("the largest is " + list[index])
```

الخرج سوف يكون بالشكل التالي :

```
Python 3.8.8 (default, Apr 13 2021, 15:08:03) [MSC v.1916 64 bit (AMD64)]
Type "copyright", "credits" or "license" for more information.

IPython 7.22.0 -- An enhanced Interactive Python.

In [1]: runfile('C:/Users/M.tech/Desktop/untitled0.py', wdir='C:/Users/M.tech/Desktop')
the largest is Programming

In [2]:
```

السؤال الثاني :

تحويل الرقم المدخل من قبل المستخدم بالعشري الى الشكل الثنائي:

```
number = int(input("Enter a number in decimal to conver into binary: "))
result = ""
while number != 0:
    remainder = number % 2
    number = number // 2
    result = str(remainder) + result
print("The equivalent binary number is: ", result)
```

الخرج سوف يكون بالشكل التالي :

```
Python 3.8.8 (default, Apr 13 2021, 15:08:03) [MSC v.1916 64 bit (AMD64)]
Type "copyright", "credits" or "license" for more information.

IPython 7.22.0 -- An enhanced Interactive Python.

In [1]: runfile('C:/Users/M.tech/Desktop/untitled0.py', wdir='C:/Users/M.tech/Desktop')

Enter a number in decimal to conver into binary: 13
The equivalent binary number is: 1101

In [2]:
```

السؤال الثالث :

```
import json
```

```

f = open('D:\\database.json','r')
d = json.load(f)
f.close()
print(d)
for i in range(0,50):
    state = input("Are you a Translator User 'u' ? or a Translator Developer 'd'
? Enter 'e' to exit")
    if state == 'e':
        break
    if state == 'u':
        prompt = input("Enter an English word to translate into Arabic:")
        if prompt in d.keys():
            print(d[prompt])
        else:
            print("Word " + prompt + " does NOT match.")
    elif state == 'd':
        enWord = input("Enter English Word:")
        arWord = input("Enter the equivilant translation:")
        d[enWord] = arWord
        f = open('D:\\database.json','w')
        d = json.dump(d,f)
        f.close()
    else:
        print("Wrong Character was inserted! please enter 't' or 'd'")

```

السؤال الرابع :  
تشكيل صنف من النوع التالي :  
:Class car

```

class mobile_phon:
    def __init__(self, mode='', model=0):
        self.mode = mode
        self._model = model
    def setMode(self, mode):
        self._mode = mode
    def setModel(self, model):
        self._model = model
    def getMode(self):
        return self._mode
    def getModel(self):
        return self._model

```

```

    def __str__(self):
        return "Mode is: "+self._mode+" - Model: "+str(self._model)
class iphon(mobile_phon):
    def __init__(self,mode='', model=0,age=0):
        super().__init__(mode,model)
        self._age = age
    def manifact(self):
        print("The mobile_phon was made by *iphon* ")
class samsong(mobile_phon):
    def manifact(self):
        print("The mobile_phon was made by *samsong*")

```

وللاستفادة من الاصناف السابقة:

```

from mobile_phon import *
phon1 = iphon('red',2019,5)
phon2 = samsong('blue',2018)
print(phon1)
print(phon2)
phon1.manufacturer()
phon2.manufacturer()
print("phon1:")
print(phon1.getMode())
print(phon1.getModel())
print("phon2:")
print(phon2.getMode())
print(phon2.getModel())

```

سوف يتم رفع الوظيفة على ال

Github
